Push APIs

ADD-ON **This may be an add-on package component.** This feature may be part of an add-on package that requires a separate purchase. Not all users will have access. Learn More

Control Center also maintains a “push API” system that sends a programmatic notification to your application whenever a certain event occurs. For example, you might choose to receive notification when a device nears its data limit. Or, you might want to know if a device makes too many connections during a certain period of time.

To receive a notification, you must create an automation rule in Control Center and then configure it to send an API message. For this process to work, you need to set up a push receiver, or server, on your end to listen for messages, interpret the data, and then act on it appropriately.

While the majority of push APIs are associated with automation rules, Control Center also provides push APIs that allow service providers to automate SIM ordering and add-on package ordering. In addition, some REST APIs use push APIs to deliver asynchronous responses, also known as callbacks. See Asynchronous Responses.

Learn more about Lite account differences.

Enabling Push APIs

Without Simplified Packaging, an enterprise must purchase an automation add-on package (Essential Automation or Advanced Automation) in order to use push APIs. For some push APIs, the enterprise must purchase another add-on package as well. For example, to use Location Based Services push API, an enterprise must also purchase the Location Based Services **(ADD-ON)** package. See Add-on Packages for more information about the various packages.

Service providers always have access to the non-automation rule push APIs. Service providers also have access to the rule push APIs when creating rules for Advantage accounts, regardless of whether the accounts have purchased an automation package. However, service providers cannot create rules (or use rule push APIs) for Essential accounts unless the accounts purchase the required add-on packages. There are two exceptions to this restriction: service providers can create SIM Account Change and Available Static IP Address rules for any Essential account.
